                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAZ37473-Z37738 represent human mdm2 phosphorothioate oligonucleotides. AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, the present an animal having a disease or condition associated with mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Autoimmune disease; polymorphic microsatellite repeat; PMR; CD28 gene; CTLA4 gene; costimulatory receptor gene locus; CGRL; lupus; insulin-dependent diabetes mellitus; IDDM; Addison's disease; leprosy; Graves disease; autoimmune hypothyroidism; myasthenia gravis; thymoma; thyroiditis; postpartum thyroiditis; rheumatoid arthritis; the postpartum thyroiditis; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20
                                                                                    PCR primers AAA96409-10 were used to amplify polymorphic microsatellite repeat (PMR) sequences from the human costimulatory receptor gene locus (hCGRI). The primers are used in the method of the invention. The specification describes a method for determining the predisposition of a human subject to develop autoimmune disease. The method comprises detecting a PMR sequence in the CD28, ICOS gene or CTLA4 gene of the human costimulatory receptor gene locus (hCGRI). PMR sequences vary in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hashimoto's disease; coeliac disease; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAA96410
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo
human costimulatory receptor gene locus (hCGRL). PMR sequences vary length among individuals and can be amplified to generate products differ in size. These products can then be detected by rapid and convenient high resolution processes. The method is useful for

PMR sequences within hCRGL are useful as markers in a variety of assays and in the field of forensic medicine, disease diagnosis and human genome
                                               The present sequence is that of interspersed repeated sequence PCR (I PCR) primer ALUS used to identify human-specific sequences in yeast artificial chromosomes (YAC) derived from the human chromosome 1q23.3 region. The chromosomal region contains the locus associated with absorptive hypercalciuria (AH). IRS-PCR fingerprints were generated, genes contained within YACs were identified by exon trapping. cDNA corresponding to the AH gene was isolated (see AAZS376). Identificat of the AH genomic region allows genetic screening for increased risk developing AH or osteoporosis with hypercalciuria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primers AAA14945-47 were used to amplify DNA containing the repeated DNA sequences Alu. The amplified fragment was used as a probe of the invention. The specification describes probes which are used for chromosomal labelling. The probes consist of a set of DNA segments represented at higher level in certain chromosomal bands and produced by TRS-PCR (interspersed repeat sequence-polymerase chain reaction) using primers specific for the repeated DNA sequences Alu and LINE. The probes are used for studying karyotypes, including those associated with chromosomal rearrangements, particularly in multicolour fluorescent in

The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding Jyycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopoietic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothicate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha menemic nua

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAK95176 standard; DNA; 20
                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA
                                                                                                                                                                                                                                                                                                                                              libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EP1130094-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; full length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human mdm2 phosphorothioate oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2001-190948/19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 06-FEB-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US6184212-B1.

The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                                                                                                                                 The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 02-MAY-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 9; Col 33; 77pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                á
                                                                                   CC includes kits for determining the presence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPs primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabete includent traits include diseases, cost of traits also include symptoms of or susceptibility to multifactorial CC diseases, including, rheumatoid arthritis, multiple sclerosis, pathogenic confiammation, cancer, nervous system diseases and infection by pathogenic confiammation, cancer, nervous system diseases and infection by pathogenic confiammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmuno diacute intermittent porphyria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP
                                                                                                                                                                                                                                                                                                                                                                                                                               primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention
                                                                         inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
The present invention relates to antisense compounds, 8-30 nucleobáses in CC length targeted to the 5' untranslated region, translation termination CC codon region, 3' untranslated region, coding region or translation start CC site of a nucleic acid encoding human mdm2, where the antisense compound CC modulates the expression of human mdm2. The antisense oligonucleotides of CC the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having CC adisease or condition associated with amplification of mdm2 gene or CC expression of mdm2 e.g. a hyperproliferative disorder such as cancer CC (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, CC fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be CC administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound, is also useful CC method, which involves the use of the antisense compound, is also useful CC method, which involves the use of the antisense compound, is also useful CC diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAS29506;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human mdm2 antisense oligonucleotide 31791

               The present invention relates to antisense compounds, 8-30 nucleobases in length targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; mdm2; hyperproliferative disorder; cancer; psoriasis;
atherosclerosis; tumour; cytostatic; anti psoriatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligonucleotides of the present invention \mathcal{L}_{\mathcal{L}_{\mathcal{L}}}
                                                                                                                                                                                                                                                                                                                                                    nucleobases targeted a region (e.g. tr of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human mdm2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-NOV-2001

The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense oligonucleotides of the present invention
              The present invention relates to antisense compounds, 8-30 nucleobases length targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation stan
                                                                                            nucleobases targeted a region (e.g. translation of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                           26-MAR-1998;

CC modulates the expression of human mdm2. The antisense oligonucleotides of CC the invention are useful for encoding human mdm2 and for inhibiting the CC expression of human mdm2. They may be used for treating an animal having CC a disease or condition associated with amplification of mdm2 gene or CC (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, CC fibrosis, atherosal-erosis or restenosis, timeours, colorectal carcinoma CC and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. CC administered with a chemotherapeutic agent to overcome drug resistance. CC The antisense compound reduces hyperproliferation of human cells. The CC method, which involves the use of the antisense compound, is also useful CC for detecting the role of mdm2 expression in various cell functions and CC diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense CC oligonucleotides of the present invention

New expression vectors for use in animal cells (e.g. pMS, pSG evectors), useful for producing recombinant proteins in various cells and recombinant protein having a unique structure and fur function. and and pMSG

Example 1; Page 77; 85pp; English

The invention relates to new expression vectors for animal cells comprising a beta-globin nuclear matrix attachment region (MAR) sequence or its complementary sequence at 5'-terminal end of a promoter and/or a SV40 virus poly-A signal and transcription termination site of gastrin gene. The expression vectors are useful for producing recombinant proteins in various animals cells and recombinant protein having a unique structure and function. The vectors, which have increased expression efficiency and levels for foreign genes, are useful for expressing foreign proteins used in an animal cell system, e.g. tumour growth factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC length, targeted to a nucleic acid molecule encoding a human cellular CC apoptosis susceptibility gene (CAS or CCSE) or CCSP), located on chromosome CC 20q13. CAS has been implicated in the regulation of mitosis, apoptosis CC and cellular proliferation and is highly expressed in some cancer cells. CC CAS has also been shown to mediate export of importin-alpha from the CC uncleus. Importin-alpha is a nuclear import receptor for nuclear CC consists in signal-containing proteins and deregulation of importin CC transport is involved in cell cycle defects. The antisense compounds compounds in the specifically hybridise with, and inhibit expression of, the gene or CC specifically hybridise with an 8 nucleobase portion of its active site. CC treating an animal having a disease or condition associated with a ccellular apoptosis susceptibility gene in cells or tissues and for creating an animal having a disease or condition associated with a ccellular apoptosis susceptibility gene, where the disease or condition is a hyperproliferative disorder such as cancer, preferably breast or colon cancer, degenerative disorders such as cancer, preferably breast or colon cancer, degenerative disorders such as labelmer's disease, Parkinson's CC disease, amystrophic lateral sclerosis (ALS), retinitis pigmentosa and blood cell disorders. The compounds are also useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for antisense gene therapy and prophylactically (e.g. to prevent or delay infection, inflammation or tumour formation. The antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides and methods for modulating the expression of human or mouse casein kinase 2-alpha prime. The antisense oligonucleotides are useful for inhibiting the expression of casein kinase 2-alpha prime, and for treating diseases or conditions associated with aberrant expression of casein kinase 2-alpha prime. Such diseases include diabetes mellitus, and hyperproliferative disorders (particularly cancers e.g. breast cancer, prostate cancer, or liver cancer). The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. ABS67840-ABS67917 represent human or mouse casein kinase 2-alpha
therapeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a hamatopoietic disorder, a bone metabolism or cholesterol disorder, various types of
                                                                                                    nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase in cells or tissues. The oligonucleotides can be administered
                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                               Example 15; Page 89; 141pp;

                                                                                                                                                                                                The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibite the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered therapeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, various types of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cancer, neurological conditions such as Alzheimer's disease and other deregulated apoptotic pathological conditions. This polynucleotide sequence represents a human caspase 6 oligonucleotide relating to the invention. NOTE: This phosphorothicate oligonucleotide sequence has 2'-MOE wings and

                                                                                                                                                    The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered therapeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a hone metabolism or cholesterol disorder, various types of cancer, neurological conditions such as Alzheimer's disease and other deregulated apoptotic pathological conditions. This polynucleotide sequence represents a human caspase 6 oligonucleotide relating to the invention. NOTE: This phosphorothioate oligonucleotide sequence has 2'-MOE wings and

The clone multiwell plates numbered for discrimination are mixed in each of the comultiwell plates numbered for discrimination are mixed in each of the cumultiwell plates numbered for discrimination are mixed in each of the cumultiwell plates; (b) a primer designed based on the chromosome marker comultiwell plates; (b) a primer designed based on the chromosome marker comultiwell plates containing the clones having said marker is detected from the resultant complified product to specify the discrimination Nos. of the multiwell complates containing the clones having said marker sequence; (d) the order complified product to specify the discrimination Nos. to array the multiwell complates; (e) the clones in the multiwell plates of the specified complates; (e) the clones in the multiwell plates of the specified complates; (e) the maxer amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals care detected from the amplified products; (h) the clones in the multiwell complates are specified from the detected result; and (i) the clones are
                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                  reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABL43323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    JP2001321190-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of arraying genome clones. The comptises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in committeell plates numbered for discrimination are mixed in each of the complification plates; (b) a primer designed based on the chromosome marker complified product to specify to the marker is detected from the resultant complified product to specify the discrimination Nos. of the multiwell complified product to specify the discrimination Nos. of the multiwell complified product to specify the discrimination Nos. of the multiwell complified product to specified discrimination Nos. of the multiwell completes; (e) the clones in the multiwell plates of the specified complates; (e) the clones in the multiwell plates of the specified complates; (e) the clones in the multiwell plates of the specified complateral directions; (f) the mixed clones are cultured and the complete complete the specified by using the above primer; (g) signals care detected from the amplified by using the above primer; (g) signals complete are specified from the detected result; and (i) the clones are mixed respectively in each wells of lones in the multiwell plates are specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The constraints are specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The constraints for human chromosome 21922.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

```
The present sequence is that of a reverse primer used, with the forward CC primer given in ABA92186, in PCR analysis of polymorphism 506B13CA1 CDX51042). This was 1 of 3 novel markers identified in a genotype CC analysis of x-linked congenital stationary night blindness (CSNB) CF families. The new, and some previously known, markers allowed an analysis of selected recombinant x chromosomes to determine the CSNB1 minimal CC physical map of the CSNB1 minimal region in xp11.4 was developed. This CC physical map of the CSNB1 minimal region in Xp11.4 was developed. This CC physical map of the CSNB1 minimal region in Xp11.4 was developed. This CC physical map of the CSNB1 minimal region in Xp11.5 An extended CC NALPN CDNA sequence (see ABA92185) was established by sequencing of PCR and RACE products obtained from retinal RNA. 11 Different mutations were CC identified in NALPN, none of which were observed in normal individuals. These included missense mutations, insertions and deletions of the coding region that are predicted to disrupt specific functions of nyctalopin, CC and may be informative as to the structure-function relationship of the CC and such informative as to the structure function relationship of the CC and such information of the NALPN gene will also provide a tool for the NALPN gene will also provide a tool for the control of the NALPN gene will also provide a tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene will also provide at tool for the control of the NALPN gene and the control of the NALPN gene and the control of the NALPN gene and th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CThe present sequence is that of a reverse primer used, with the forward CC primer given in ABA92207, in PCR analysis of polymorphism 506B13CA1 (C (DXS10042). This was 1 of 3 novel markers identified in a genotype CC analysis of X-linked congenital stationary night blindness (CSNB) CC families. The new, and some previously known, markers allowed an analysis CC of selected recombinant X chromosomes to determine the CSNB1 minimal CC region. To identify candidate genes for the CSNB1 locus, a robust CC physical map of the CSNB1 minimal region in Xp11.4 was developed. This CC identified the NYX gene encoding nyctalopin (see AAM51131). An extended CC NYX CDNA sequence (see ABA92206) was established by sequencing of PCR and CC identified in NYX genes from retinal RNA. 14 Different mutations were CC identified in NYX genes from different CSNB families, none of which were observed in normal individuals. These included missense, insertion, stop and deletion mutations that are predicted to disrupt specific functions CC of nyctalopin. The invention provides a method and kit for diagnosing CC complete X-linked CSNB, which involves screening for alterations in the CC candidates that affect nyctalopin expression or production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 493
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

```
transcriptase), where the compound specifically hybridises with and inhibits the expression of TERT. A series of oligonucleotides were designed to target different regions of the human TERT RNA. These were 20 nucleotides in length and composed of a central gap region consisting of ten 2'-deoxynucleotides, flanked on both sides (5' and 3' directions) by five-nucleotide wings. The wings were composed of 2'-methoxyethyl (2'-mothotides. The compounds were analysed for their effect on human TERT mRNA levels by reverse transcriptase (RT)-polymerase chain reaction (PCR). The compound is useful for inhibiting the expression of TERT in compound is useful for inhibiting the expression of TERT in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel fluorescent labelling techniques and fluorescent labels. The method and compositions of the invention are useful for detecting molecules using fluorescent labels where fluorescent intercalating dyes have strong non-covalently binding affinities for the dsDNA. The method is useful for detecting molecules e.g. nucleic acids, in electrophoresis methods. The method can also be applied to diagnostic assays and cell labelling. The fluorescent label is sensitive, stable and resistant to self-quenching. The present sequence represents a PCR primer used to amplify human DNA derived from chromosome 21

Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase treating diseases or conditions, e.g. amyotrophic lateral sclerosis 1, for modulating conditions, e.g. and

Example 15; Page 77; 107pp; English

The invention relates to a compound of 8-50 nucleobases in length, CC targeted to a nucleic acid molecule encoding human superoxide dismutase CC 1. The compound specifically hybridises with and inhibits the expression CC of human superoxide dismutase 1 by hybridising with at least an 8CC nucleobase portion of the nucleic acid molecule encoding the active site CC for the enzyme. The activity of compounds of the invention may be CC described as neuroprotective, cytostatic and antiinflammatory. The CC mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate CC oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. CC compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), cespecially amyotrophic lateral sclerosis, a disease or condition arising CC used in diagnostics, therapeutics and as a research reagent, e.g. cused in diagnostics, therapeutics and as a research reagent, e.g. comparation. Sequences given in records ACC40880-ACC40957 represent human construction of tumour conditions are antisense inhibitor oligonucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to human acetyl-Coenzyme A-carboxylase-alpha (ACC-alpha; see ABZ79442), which can be used for in vitro diagnosis of cancer (or of an increased risk of developing it), by detecting ACC-alpha gene mutations or polymorphisms, or altered ACC-alpha protein expression, relative to a control population. The method is particularly used to diagnose cancer, especially of breast or ovary, or for assessing the risk of developing such cancers. The present sequence is a PCR primer, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human GH-1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 20
                                                                                                               The invention relates to growth hormone 1 (GH-1) gene including single nucleotide polymorphisms (SNP). The GH-1 diagnostic polymucleotide is useful as markers for the analysis of a disease, of susceptibility to drug treatment for GH-1 dysfunction or other diseases, or may be included in any complete or partial genetic map of the human genome. GH-1 mutant polypeptides are useful as antagonists of GH-1 hormone action. Polymucleotides encoding these polypeptides are useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               27-AUG-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADD21702

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense compound targeted to 5' untranslated region, region, or intron: exon junction of nucleic acid molecule encuseful for treating e.g. cancer, psoriasis or restenosis by i

WPI; 2003-229219/22

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Disclosure; SEQ ID NO 13153; 872pp; English

The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of

ubiquinone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
CC immunosuppressive, and cytostatic activity. The composition may have a continuing and/or cc antiinflammatory steroid and ubiquinone. A composition of the invention cc antiinflammatory steroid and ubiquinone. A composition of the invention cc antiinflammatory, antiallergic, antiasthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a cc use in antisense gene therapy. The composition is useful for treating or cc preventing a respiratory, lung or malignant disease or condition, also cc for enhancing the prophylactic or therapeutic respiratory effect of an cantiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or clung surfactant in a subject tissue, or treating bronchoconstriction, contein the sequence data for this patent is not represented in the printed case of the composition, but was obtained in electronic format directly from WIPO case for wine information, which is held not remembered.

Crimitiation relates to a novel pharmaceutical composition, which has a crive agent comprising an oligonucleotide antisense to the crimitiation codon, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding and 3' intron-exon junctions, or regions within 2-10 nucleotides of codinctions of genes encoding a polypeptide associated with lung and/or coding antiangual active agent comprising an companient antisense and ubiquinone. A composition of the invention code in antisense gene therapy. The composition is useful for treating or greventing a respiratory, lung or malignant disease or condition, also composition genetication, also containflammatory steroid in a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, s tissue, or treating bronchoconstriction, composition in the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fig. at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating ailments associated with impaired Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cc junctions of genes encoding a polypeptide associated with lung and/or cc masal airway dysfunction and a second active agent comprising an assal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc mass antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a cc use in antisense gene therapy. The composition is useful for treating or cc reventing a respiratory, lung or malignant disease or condition, also cc for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels cf adenosine cr ceptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine cr lung surfactant in a subject s tissue, or treating bronchoconstriction, clung sinflammation, lung allergies, or a respiratory disease or condition.

Cc Note: The sequence data for this patent is not represented in the printed case for wine int/cnih/subject and core sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its responding RNAs, and glucocorticoid or non-glucocorticoid steroid or continuity.
                                                                                                                                                                                                                                                                                                                                                                                              nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of

Disclosure; SEQ ID NO 14317; 872pp; English

ubiquinone

cc junctions of genes encoding a polypeptide associated with lung and/or cc nasal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc immunosuppressive, antiallergic, antiasthmatic, hypotensive, acc immunosuppressive, and cytostatic activity. The composition may have a cc use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also cf or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, containing inflammation, lung allergies, or a respiratory disease or condition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
CC initiation coding region, 5 or 3 end genomic flanking regions, CC initiation coding, coding region, 5 or 3 end genomic flanking regions, CC initiation coding, coding regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC inmunosuppressive, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine CC lung inflammation, lung allergies, or a respiratory disease or condition. CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO can be seen the condition of the printed of the prin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 508
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding regions, or regions within 2-10 nucleotides of cymotions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention chas antiinflammatory, antiallergic, antiasthmatic, hypotensive, cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject s tissue, or treating bronchoconstriction, lung surfactant, but was obtained in electronic format directly from WIPO or a femiliar and directly from WIPO or a femiliar directly from WIPO or a femiliar directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                   junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention antiinflammatory steroid and ubiquinone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel pharmaceutical composition, which I first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking region, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the invention has immunomobilatory, gastrointestinal, antiinflammatory CC and cardiovascular activity and can be used for gene therapy. The creeptor described in the disclosure may be implicated in regulation of CC intestinal function, blood pressure, blood flow through organs and CC regions of the body; blood coagulation, haematopoiesis and immune CC reactions; release of interleukins and prostaglandins, i.e. in CC inflammation; modulation of neuronal function and cell growth and CC differentiation. The polynucleotide of the invention which encodes a GC grotein-coupled receptor, and also its related cDNA, mRNA, protein, CC antibodies and oligonucleotides, are useful in the diagnosis and CC treatment of diseases associated with abnormal levels of P2Y34 expression CC; in screening assays for modulators, potentifing diseases associated CC with abnormal expression of P2Y34. This sequence represents a PCR primer CC used to amplify the gene encoding the human P2Y34 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 510
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                The invention describes a method of determining the ethnic origin of a male comprising obtaining a nucleic acid sample from the male, and identifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pair from the primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for determining the ethnic origin of an individual; determining the ethnic origin of an individual; determining the sethnic origin of a human male individual; an isolated nucleic acid segment of a primer of a nucleic acid segment of a primer origin of a human male individual; an isolated nucleic acid segment of a primer origin of a human male individual; an isolated nucleic acid segment of a primer origin of a human male individual; an isolated nucleic acid segment of a primer origin of a human male individual; an isolated nucleic acid segment of a primer origin of a human male individual; an isolated nucleic acid segment of a primer origin of a human male individual; an isolated nucleic acid segment of a primer origin of a human male individual; an isolated nucleic acid; a primer origin of a primer origin of a human male individual; an isolated nucleic acid; a primer origin of a primer origin of a primer or origin or or

The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's disease militaria analyzation architis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20

CC The invention describes a method of determining the ethnic origin of a CC male comprising obtaining a nucleic acid sample from the male, and CC identifying at least two polymorphic markers in the nucleic acid sample CC indicative of the ethnic origin of the male, using at least one primer CC pair from the primer pairs given in the specification. Also described is CC a method of: identifying polymorphic sites in a nucleic acid; a kit for CC determining the ethnic origin of an individual; determining the ethnic cridin of a human male individual; an isolated nucleic acid segment of a human y chromosome comprising at least 10 contiguous bases including at CC least one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the y chromosome CC individual. The method is useful for determining the ethnic origin of a complete compart of the paternity of a human male individual. The method is useful for determining the ethnic origin of a complete compart of the paternity testing, for forensic studies or for diagnosis. This sequence represents a fragment of the non-recombining region of the human cc y chromosome (NRY) comprising a polymorphism that can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The method is useful for determining the ethnic origin of a male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a fragment of the non-recombining region of the human Y chromosome (NRY) comprising a polymorphism that can be used to determine ethnic origin of a male.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining the ethnic origin of a male by obtaining a nucleic acid sample from the male and identifying at least two polymorphic markers the nucleic acid sample indicative of the ethnic origin of the male.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-NOV-2001; 2001US-00002623.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Y chromosome; paternity testing; forensic; diagnosis; non-recombining region; human; NRY; polymorphic fragment; ds

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ន្តដ្ឋន
                        The invention describes a method of determining the ethnic origin of a CC male comprising obtaining a nucleic acid sample from the male, and CC identifying at least two polymorphic markers in the nucleic acid sample CC identifying at least two polymorphic markers in the nucleic acid sample CC indicative of the ethnic origin of the male, using at least one primer CC as method of: identifying polymorphic sites in a nucleic acid; a kit for CC determining the ethnic origin of an individual; determining the ethnic origin of an isolated nucleic acid segment of a fundam Y chromosome comprising at least 10 contiguous bases including at CC least one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the Y chromosome CC individual. The method is useful for determining the ethnic origin of a CC male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a primer used to detect polymorphisms in the non-recombining region of the human Y chromosome (NRY).

                                                                        В
                                                                                                        S
                                                                                                                                                                                                                                                                    The invention describes a method of determining the ethnic origin of a male comprising obtaining a nucleic acid sample from the male, and conditiving at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer condition of the male, using at least one primer condition of the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for contigin of a human male individual; an individual; determining the ethnic origin of an individual; determining the ethnic corigin of a human with the polymorphic sites given in the specification; nucleic acid grimer pairs for amplifying polymorphic regions of the y chromosome comprising at least 10 contiguous bases including at least one of the polymorphic sites given in the specification; nucleic carid primer pairs for amplifying polymorphic regions of the y chromosome carid in the specification; and determining the paternity of a human male individual. The method is useful for determining the ethnic origin of a male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a fragment of the non-recombining region of the human cycle y chromosome (NRY) comprising a polymorphism that can be used to
                                                                                                                                              Matches

Also described is considered in the specification of the strike of the contribution of a nucleic acid; a kit for containing the ethnic origin of an individual; determining the ethnic continual; an isolated nucleic acid segment of a contain of a human male individual; an isolated nucleic acid segment of a contain one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the Y chromosome comprising at least to continual. The method is useful for determining the ethnic origin of a individual. The method is useful for determining the ethnic origin of a considered considered in the specification; and determining the paternity of a human male considered in the method is useful for determining the ethnic origin of a considered co

The methods are useful for determining the presence of a disorder, treating inflammation, Familial cold urticaria/familial cold autoinflammatory syndrome (FCU/FCAS) or Muckle Wells Syndrome (MWS), and identifying a substance useful in modulating binding of a cryopyrin protein to a second protein. The oligonucleotide is useful in diagnosing a disorder characterized by an aberrant CIASI gene. This sequence corresponds to a primer used to amplify the cryopyrin gene of the

cc surfactant depletion or hyposecretion, when administered to a mammal. The capture of coligonucleotides are derived from a gene encoding or regulating conjugation of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the invention has antiallergic, antiinflammatory, antiasthmatic, considered in the invention has antiallergic, antiinflammatory, antiasthmatic, considered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The conformation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, considered inflammation, allergies, asthma, impeded respiration, respiratory hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system ceg., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, all reducing adenosine sensitivity, levels of adenosine (A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted bronchodilating agent. nucleic acids associated with lung airway or lung dysfunction, ç

SEQ ID NO 13256; 763pp; English

CC comprising oligonucleotides, effective for alleviating
CC pronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC inflammation, allergies and/or burnchoconstriction and/or lung
CC with a disease or condition such as pulmonary vasoconstriction
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC the oligonary into the target RNA serves to prevent the breakdown of
CC the oligonary into the administic the breakdown of
CC the oligonary into the administ the forms administering the corresponding to
CC the oligonary the content of the anti-sense oligos corresponding to This invention describes oligonucleotides into products that ., lung, brain, heart, kidney, etc, t vent any unwanted effects due to it a novel composition (a) a first active agent, tissue environment free adenosine into the system

ß Li Y, Tang ŗ Sandrasagra A, C, Shahabuddin Katz E, Pabalan ç Aguilar D;

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent. ö

Claim 15; SEQ ID NO 13153; 763pp; English

CC comprising of injunction, respiratory tract inflammation, allergies and composition gadenosine sensitivity, levels of adenosine (A) or (A) receptors, comprising of ignnucleotides, effective for alleviating controlled adenosine sensitivity, levels of adenosine (A) or (A) receptors, consider the depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating controlled at target polypeptide associated with lung airway or lung controlled internation also describes a kit, that comprises: (a) a delivery controlled internation also describes a kit, that comprises: (a) a delivery controlled internation and for use of the invention has antiallergic, antiinflammatory, antiasthmatic, controlled in hypotensive, immunosuppressive and cytostatic activity, is a composition for adding a carrier and for use of the kit. The composition composition are septiatory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoonstriction, confidence, palin, cystic fiborosis, allergic ribinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary cancer. hypertension, emphysema, GRIGHLE OFFICERS, bronchitis or cancer. transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the reduced adenosine content the serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the system. This invention describes a novel composition (a) a first active agent,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    e.g., lu
prevent
                                           comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the ollgonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;

pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonnucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating

Ħ ö 763pp; English

comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies reducing adenosine sensitivity, levels of adenosine (A) or (A) This invention describes a novel composition (a) a first active receptors, agent,

```
CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a CC beta-adrenergic agonist. The composition is useful for preventing or CC treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to CC reduce the amount of target polypeptide present in the lungs. The CC pulmonary obstruction, and/or burnchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, comprises syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonacleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 522
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

Conjugate to the street from a general encounty of regulations of a target polypeptide associated with lung altrway or lung conversion of a target polypeptide associated with lung altrway or lung conversion also describes a kit, that comprises: (a) a delivery of device, in separate containers, (b) the oligonucleotides, (c) analysic, in separate containers, (b) the oligonucleotides, (c) of the invention has antiallergic, antiinflammatory, antiasthmatic, of analysic, hypotensive, immunosuppressive and cytostatic activity is a beta-adrenergic agonist. The composition is useful for preventing or composition composition composition of the administered composition composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The cumposition, allergies and/or bronchoconstriction and/or lung pulmonary obstruction, and/or bronchoconstriction and/or lung confiammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confiammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confiammation, emphysema, chronic obstructive pulmonary disease, pulmonary confiammation, emphysema, chronic obstructive pulmonary disease, pulmonary the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine into the system of the oligonucleotides and effected fine to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) recept surfactant depletion or hyposecretion, when administered to a mammal oligonicleotides are derived from a gene encoding or regulating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Comprising oligonucleotides, effective for alleviating
C bronchoconstriction, respiratory tract inflammation, allergies and
C reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
C oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vascoconstriction, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC the reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC products and thereby, etc, tissue environment and thereby, to
CC products and content of the anti-sense oligos corresponding to
CC products and content of the anti-sense oligos corresponding to
CC products and content of the anti-sense oligos corresponding to
CC products and content of the anti-sense oligos corresponding to
CC products and content of the anti-sense oligos 
                                                                                                                                                                                                           RESULT 524
